

Infinity USD (IUSD)

TRON TRC-20 Smart Contract Security Assessment

Assessment type	Source-code-based security assessment / self-assessment
Network	TRON Mainnet
Contract address	TG8Nn8N58AJ7dEfXkzXsWTpVueVhLneaKB
Website	https://tetherlyus.com
Assessment date	17 August 2026
Report version	1.0
Important limitation	This report is not an independent third-party audit.

1. Executive Summary

This assessment documents the Infinity USD (IUSD) project using the supplied security-assessment source as the structural basis, with the project identity updated to Infinity USD (IUSD), the supplied TRON contract address, and the supplied website. The assessment is explicitly a source-code-based self-assessment and must not be represented as an independent third-party audit.

2. Project Identification

Token name: Infinity USD

Symbol: IUSD

Network: TRON Mainnet

Token standard: TRC-20

Contract: TG8Nn8N58AJ7dEfXkzXsWTpVueVhLneaKB

Website: <https://tetherlyus.com>

3. Scope and Evidence

The supplied reference assessment describes a TRC-20-compatible token using SafeMath, standard balances and allowances, transfer/approval operations, and an internal mint function. It records 6 decimals and a 10,000,000,000-token constructor supply. Those technical characteristics are reproduced here only as source-derived characteristics; they should be confirmed against the deployed IUSD bytecode and live contract state before publication as a definitive assessment.

4. Security Review Matrix

Finding	Severity	Assessment
Unauthorized minting	Low / Informational	PASS — source-based; no public/external mint pathway is described.
Administrative centralization	Informational	PASS — the reference source contains no owner/admin, pause, blacklist, or upgrade mechanism.
Arithmetic safety	Pass / Informational	PASS — arithmetic operations use SafeMath in the reference source.
Zero-address protection	Pass / Informational	PASS — source review identifies zero-address rejection where appropriate.
Reentrancy	Informational	No direct issue identified; token operations do not perform external calls in the reviewed source.
Approval race condition	Low	Design consideration associated with the conventional approve pattern; increase/decrease allowance.

Finding	Severity	Assessment
Fixed supply / constructor mint	Informational	Disclosed — reference source mints 10 billion whole tokens at construction.
Metadata dependency	Low / Informational	Operational consideration where metadata depends on an external URL.

5. TRC-20 Interface Review

The reference source assessment identifies `totalSupply()`, `balanceOf(address)`, `transfer(address,uint256)`, `allowance(address,address)`, `approve(address,uint256)`, `transferFrom(address,address,uint256)`, `Transfer`, `Approval`, `increaseAllowance()`, and `decreaseAllowance()` as present. These functions should be checked against the deployed IUSD contract before treating this section as an on-chain verification.

6. Supply Analysis

The reference assessment specifies 6 decimals and a constructor mint of 10,000,000,000 whole tokens. At 6 decimals, that corresponds to 10,000,000,000,000,000 base units. This report therefore records the intended/reference supply as 10 billion IUSD, subject to on-chain verification.

7. Access Control and Upgradeability

The reference source contains no Ownable mechanism, owner variable, role-based access control, blacklist authority, pause authority, or upgrade authority. It also describes no proxy, delegatecall-based upgrade mechanism, implementation setter, or deprecation mechanism. These conclusions are source-derived and should be independently confirmed against the deployed IUSD contract.

8. Website and Metadata

Project website supplied for this assessment: <https://tetherlyus.com>. A website is an off-chain project resource and does not by itself prove ownership, authorization, token backing, liquidity, market value, or security. Any token metadata hosted externally should be checked for availability and consistency with the deployed contract.

9. Deployment Verification Requirements

Before presenting this document as a definitive assessment of the deployed contract, verify the contract on TRONSCAN and compare the deployed bytecode with the exact source and compiler settings. Confirm the token name, symbol, decimals, `totalSupply`, `deployer balance`, `transfer/approval` behavior, emitted events, and absence or presence of administrative functions. TRONSCAN documentation indicates that contract-detail data can include verification status, proxy status, method maps, and token information.

10. Overall Assessment

Based on the supplied reference source assessment, no Critical or High-severity vulnerability was identified in that source. One Low-severity allowance design consideration and a metadata availability consideration were noted. This conclusion is not an independent audit and does not constitute a guarantee of the deployed Infinity USD contract.

11. Important Disclaimer

This document is a source-code-based self-assessment. It is not an independent third-party audit and must not be represented as one. It does not constitute financial, legal, or investment advice and does not guarantee token value, reserves, liquidity, exchange listing, wallet support, TRONSCAN acceptance, or future performance. The project identity in this document is Infinity USD (IUSD); no affiliation with any similarly named third party is established by this report.

12. Assessment Record

Item	Value
Contract	TG8Nn8N58AJ7dEfXkzXsWTpVueVhLneaKB
Website	https://tetherlyus.com
Source language	Solidity
Reference compiler	0.5.10
Token	Infinity USD (IUSD)
Decimals	6 (reference/source characteristic; verify on-chain)
Reference supply	10,000,000,000 IUSD
Assessment type	Self-assessment / source-code review
Independent auditor	Not claimed
Report version	1.0
Date	17 August 2026
